

Final Project Design Phase—Generic Website

Computer Science - Week 11

Feb 23, 2026 - Version 0.0.2

As a reminder, here are the site functionality requirements. For complete instructions and project ideas, refer to the assignment in Canvas.

Site Functionality Requirements

Please refer to the requirements listed in your Canvas course.

1) Site Diagram

Add photo(s) or screenshot(s) of your website mock-up diagram below.

title

Direction

2) Implementing Requirements

This table should serve as a draft for how you will implement the requirements into your final project. You may change your ideas later on, but your final site must fulfill all the requirements.

Requirement	Implementation
Purpose/Functionality A 1-2 sentence description of the purpose or functionality of your site	The purpose is a matchup prediction using NBA teams and giving an estimated result and box score. Using a database of every nba player starting 5 and 3-4 rotational players an estimate will be achieved and displayed can also take one step further and make it a prediction game like sports betting.
State Dataclass Attributes Minimum of 4 attributes, one of which must be a list/dict of instances of your second dataclass. Briefly describe each attribute, its type, and how it will be meaningfully modified throughout the site.	<pre>@dataclass class Team: Name: str Rating: str Confrence Members: list[Player]</pre>
Second Dataclass Your second dataclass, including its attributes, their types, and how they will be meaningfully modified (if they are modified)	<pre>@dataclass class Player: name: str position: str PPG: int APG: int RPG: int</pre>
Routes (minimum 7) The names of your route functions	index, select_teams, view_team, simulate_matchup view_box_score, submit_pick results
Pages (minimum 5) A brief description of the pages in your site	Home Page: Introduces the website and explains the game. Team Selection Page Lets the user choose between a randomized home team and away team. Team Roster Page: Shows the selected team's starting 5 and key rotation players. Prediction Game Page: Lets the user make their own pick, choosing the winner or player pts reb or ast. Matchup Prediction Page: Runs the matchup and displays the winner and estimated final score.

	Projected Box Score Page: Shows projected stats for key players, like points, rebounds, and assists. Results Page: Displays the matchup result along with the user's submitted prediction and if True or False.
User Input (minimum 3) Description of user input components (TextBox, TextArea, CheckBox, or SelectBox) and their purposes For more information on these input types, see Drafter Documentation.	Choosing team (select box), Choosing prediction subject (select box) , making prediction (text box)
If Statements (minimum 3) Brief description of what will be evaluated in your if statements and how they will meaningfully change the logic of the site	Using an if statement to decide if predictions are correct If user input == to predicted in terms of pts ast game score or winning team.
Loop (minimum 1) This loop must iterate over the list/dict of dataclass instances in your State attribute. Description of this loop and why it is meaningful to the site	A loop will be used to simulate the game by using possessions and random cases to decide what team scores and what player by splitting odds for example teams will have 50% chance of scoring star players will have 60% chance of scoring based of team and rotation 30% and so on and repeat that instance to simulate a game.

Final Submission

When you are finished, download this file as a Word Document (docx) and upload the file to the appropriate assignment on Canvas.
